

Gaurav Nandhan BA Studio

The Exhaustive Enterprise User Manual

Target Audience: Business Analysts, Product Managers, QA Engineers

Version: Enterprise Edition v1.0.0

Last Updated: May 2026

1.0 Introduction to the BA Studio

Welcome to the future of enterprise software design! The Gaurav Nandhan BA Studio is essentially a highly intelligent, automated Business Analyst that lives inside your computer. Normally, building software requires a human Business Analyst to spend weeks attending meetings, taking notes, formatting Word documents, and drawing diagrams in Visio.

With this Studio, you bypass all of that. You simply paste your meeting notes (MOM) into the chat, and the Artificial Intelligence (AI) instantly writes perfect, BABOK-compliant requirements, draws the diagrams, and even generates clickable prototypes for you. It does all of this in a matter of seconds, saving you thousands of hours.

Analogy for Beginners: Think of the AI as a magical builder. You don't need to know how to pour concrete or lay bricks. You just tell the builder, "I want a blue house with 3 bedrooms," and the builder instantly gives you the blueprints, the wiring diagrams, and a 3D model of the house!

2.0 Getting Started (Login & Setup)

2.1 Secure Login

Before you can use the system, you must log in. Because this is an enterprise platform, your data is highly secure.

- 1 Go to the BA Studio URL provided by your IT department.
- 2 Click the **Sign In** button located at the top right of the screen or the bottom left of the navigation bar.
- 3 Enter your corporate email address and password. If your company uses Google or Microsoft Single Sign-On (SSO), click the respective button.

Once logged in, you will be directed to the Main Dashboard, your Command Center.

2.2 Understanding Your Role (RBAC)

Your IT department assigned you a specific "Role" when they created your account. This controls what you are allowed to do:

- **ADMIN:** You can do everything, plus see the Billing and User Management dashboards.
- **MEMBER:** You can chat with the AI, generate all documents, and export them to PDF or Jira.
- **VIEWER:** You can only read documents that other people have generated. You cannot type in the chat box or click "Generate" (this protects the company's AI

billing limits).

3.0 The Magic Chat Box (Intake & Analysis)

The very first step in any project is telling the AI what you want to build. You do this using the Chat Box at the bottom of the screen.

3.1 How to Write Good Meeting Minutes

The AI is very smart, but it cannot read your mind. If you type, "make an app," it will refuse to work because it doesn't have enough information. You must provide context.

Good Example: "We just had a meeting with the hospital board. They want a web portal where patients can log in, view their upcoming appointments, and pay their bills using a credit card. The system needs to be highly secure because it handles medical data."

3.2 The AI Gatekeeper (Pushback)

When you click **Analyze**, the AI acts like a strict gatekeeper. It checks your idea against a 7-point checklist. If your idea is confusing or missing details, the AI will stop you.

For example, if you typed the "Good Example" above, the AI might reply:

"I understand you want a patient portal. However, you didn't mention how patients get an account. Do they register themselves, or does the hospital receptionist create the account?"

You must answer the AI's questions. Once the AI is satisfied with your answers, it will announce that your project is **READY!**

Security Note (AI Shield): If you accidentally type a real person's Social Security Number, Email Address, or Credit Card into the chat, don't panic! The Studio has

a built-in "AI Shield" that instantly scrubs and redacts that information before it ever leaves your computer.

4.0 Document Generation (The 11 Modules)

Once the AI says your idea is ready, the buttons on the left side of the screen will unlock. Clicking any of these buttons will command a specialized AI Agent to write that specific document for you instantly.

4.1 Business Requirements Document (BRD)

What it is: A high-level document explaining WHY you are building the software.

Who it's for: The CEO, Investors, and Business Stakeholders.

What to look for: Check the "MoSCoW" section to ensure it correctly categorized your features into "Must Have" vs "Should Have".

4.2 Functional Requirements Document (FRD)

What it is: A highly technical document explaining exactly WHAT the software must do.

Who it's for: Software Developers and Engineers.

What to look for: Check the RTM (Requirement Traceability Matrix) at the bottom to ensure every button and screen is accounted for.

4.3 System Requirements Document (SRD)

What it is: A document defining the non-functional boundaries (security, speed, servers).

Who it's for: DevOps Engineers and System Architects.

4.4 Test Cases

What it is: A step-by-step checklist of how to break the software.

Who it's for: Quality Assurance (QA) Testers.

What to look for: Ensure it includes both "Happy Path" (user does the right thing) and "Negative Path" (user types in the wrong password) tests.

5.0 Visual Architecture & UI Generation

Text documents are great for rules, but humans are visual creatures. The Studio can generate actual pictures and code!

5.1 UML Class Diagrams

If you click **UML Diagram**, the AI will generate a technical blueprint showing how your database tables connect to each other. This is critical for Backend Developers.

5.2 Mermaid Flowcharts

If you click **Flowchart**, the AI will draw a map of the User Journey. For example, it will show a box that says "User Clicks Login" with an arrow pointing to "System Checks Password", and then splitting into "Success" or "Failure".

5.3 Wireframes & Interactive Prototypes

If you click **Wireframe**, the AI will sketch a basic, gray-scale layout of what the app will look like.

If you click **Prototype**, the AI will write actual HTML and CSS code to build a colorful, clickable version of your app right inside the studio! You can literally click the buttons and see how the layout feels.

This allows you to show a client exactly what they are buying before you pay a team of engineers to build it.

6.0 Developer Automation (IaC & Playwright)

This is where the platform becomes truly magical. It doesn't just write Word documents; it writes actual engineering code.

6.1 E2E Automation Suite

If you click **Generate Playwright Script**, the AI will read the UI Prototype it just built, and write an automated testing script. When a developer runs this script, a robot browser will open up, click all the buttons on the screen automatically, and verify that the app works. This saves QA testers hundreds of hours of manual clicking.

6.2 Infrastructure as Code (IaC)

If you click **Generate Terraform**, the AI will write the exact code needed to boot up Amazon Web Services (AWS) servers to host your new application. This allows your DevOps team to deploy the infrastructure in seconds.

7.0 The Sovereign Versioning Engine (Oops, I changed my mind!)

What happens if you generate all these beautiful documents, but then your boss walks in and says, *"Wait, we need to add Apple Pay to the checkout screen!"*?

Normally, you would have to open up 10 different Word documents and manually type "Apple Pay" into all of them. In the BA Studio, the AI handles this automatically.

- 1 Go back to the Magic Chat Box and type: *"We need to add Apple Pay to the checkout screen."*
- 2 The AI will say "Understood."
- 3 Look at the top of your document screen. A bright button with a lightning bolt will appear that says "**Regenerate with v2 Updates**".
- 4 Click that button. The AI will instantly read your new requirement and rewrite the entire document to seamlessly include Apple Pay.

8.0 Exporting, Saving, & Jira Synchronization

Once you are perfectly happy with your generated documents and prototypes, you need to share them with your team.

8.1 PDF Export

Look at the Top Bar and click **Export PDF**. This will instantly convert the document you are looking at into a professional, printable PDF file that you can email to your clients.

8.2 Jira Sync

If your company uses Jira to track developer tasks, you can click **Jira Sync**. The AI will take your Functional Requirements (FRD) and automatically convert them into "Epics" and "User Stories," and push them directly to your Project Manager's Jira board. No more copying and pasting!

8.3 Saving Your Session

If you need to go to lunch, make sure you click **Save Session**. This will save all your chat history and generated documents to the secure database so you can pick up exactly where you left off tomorrow.

9.0 Troubleshooting & FAQ

Q: The AI keeps rejecting my idea and won't let me generate documents. Why?

A: The AI is programmed to require extreme clarity. If it keeps rejecting you, read its questions carefully. You are likely being too vague. Try answering its questions specifically using bullet points in the chat.

Q: I clicked "Generate Prototype" but the screen is blank. What happened?

A: Sometimes the AI hallucinates bad code. If the prototype screen is blank, simply click the **Regenerate Document** button at the top of the screen to force the AI to try writing the code again.

Q: The Top Bar buttons (like Export) are grayed out!

A: This is normal! While the AI is actively typing out a document, the buttons are disabled so you don't accidentally click them and interrupt the generation process. Just wait for the AI to finish typing.

Q: Will my company get charged every time I click a button?

A: Yes. Every time you chat or generate a document, it uses "Tokens" which cost your company money. Do not sit there clicking "Regenerate" 100 times for fun. Use the tool responsibly to build actual projects.
